### **Exact Metrology Introduces Artec Ray Laser Scanner**

*Exact's new scanner provides fast and accurate data for applications such as: reverse engineering, inspection, construction (BIM), product design, forensics, and heritage presentation.*

Exact Metrology is proud to announce the immediate availability of its new Artec Ray laser scanner. Ideal for scanning large objects like wind turbines, ship propellers, airplanes, and buildings, the Artec Ray offers ultra-high precision and speed. With the ability to scan up to 110 meters away, this scanner offers submillimeter distance accuracy and best in class angular accuracy. In addition, data capture is cleaner than with any other 3D scanner of this type and keeps noise levels at an absolute minimum. As a result, post-processing time is greatly reduced.

Scanning with Artec Ray is easy. Users need only place it on a tripod in front of the object they wish to scan and press the button. Portable and compact, the laser scanner can be set up easily indoors or outdoors. There's no need to worry about finding a power source, since the internal battery lasts up to 4 hours.

Additionally, Artec Ray is equipped with software solutions. Once scanned, the scan is processed directly into the powerful Artec Studio, then seamlessly exported to Geomagic Design X.

To obtain maximum benefits, Artec Ray can be paired with Eva or Spider handheld Artec scanners to scan hard-to-reach areas such as the interiors of cars or add intricate detail to a large-scale 3D model.
