

CALGARY, AB – July 17, 2019 – SOLV3D Announces New Product Branding and the Addition of a Widget for Esri ArcGIS Enterprise™

SOLV3D, a leading provider of 3D processing, geospatial data visualization and collaboration tools is excited to announce a new look and feel for their corporate branding and fresh new product names.

“With the progression of our product roadmap and overall vision for the company, we felt that the time was right to shift our products to the next phase in their evolution.”, states Tammy Peterson, Vice President of Marketing and Sales. “Our branding is now aligned with that vision and supports our position within the market.”

Formerly 3DPointLogic, the point cloud processing toolkit is now SOLV3D engine™ (Engine), while the visualization and collaboration platform, SiteVisit360, becomes SOLV3D encompass™ (Encompass). Functionality within both products will remain the same and continue to be enhanced and expanded, as noted in the most recent feature release.

Now available is the SOLV3D encompass Esri Enterprise Widget. “Allowing users to pull data and include a view of Encompass within their ArcGIS Enterprise Maps, further enhances our ability of supporting more and varied types of geospatial datasets.” states Chief Technical Officer, Kevin Miller. “Although users could already access ArcGIS Online content directly within their Encompass session, it is our hope that this will further provide a more synergistic and robust experience in using the two applications in concert.”

Other minor feature enhancements include; more user-friendly access to 3D Mode and the ability for Organization Administrators to access User Session Tracking Reporting.

About Us

SOLV3D is the creator of innovative software solutions for geospatial data processing, visualization and collaboration. The SOLV3D engine™ processing toolkit assists users in optimizing point cloud data for effective use within their applications and workflows. SOLV3D encompass™ provides the ability to merge together a myriad of geospatial datasets in a single platform. Within a web-based environment, it enables all stakeholders to easily gain situational awareness and work together on projects, AOIs and assets, regardless of geographical location or level of expertise.
